# IT Organization Patterns

## Organized by IT Functions

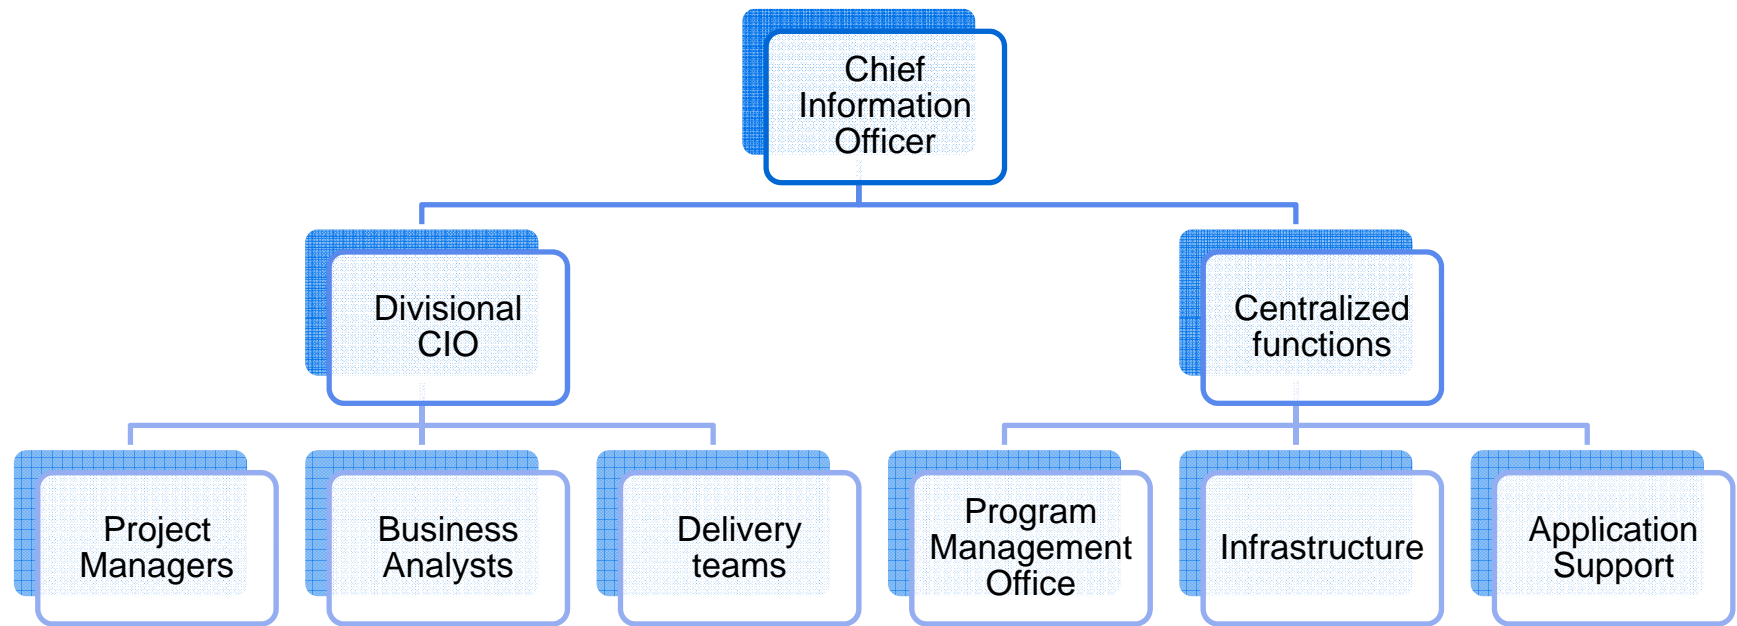

- Organized by IT functions
- Each team directly interfaces with the business
- Typical for IT organization with large packaged application implementations
- Each team is headed by the delivery chief (reports to the CIO) and has the following structure

# IT Organization Patterns

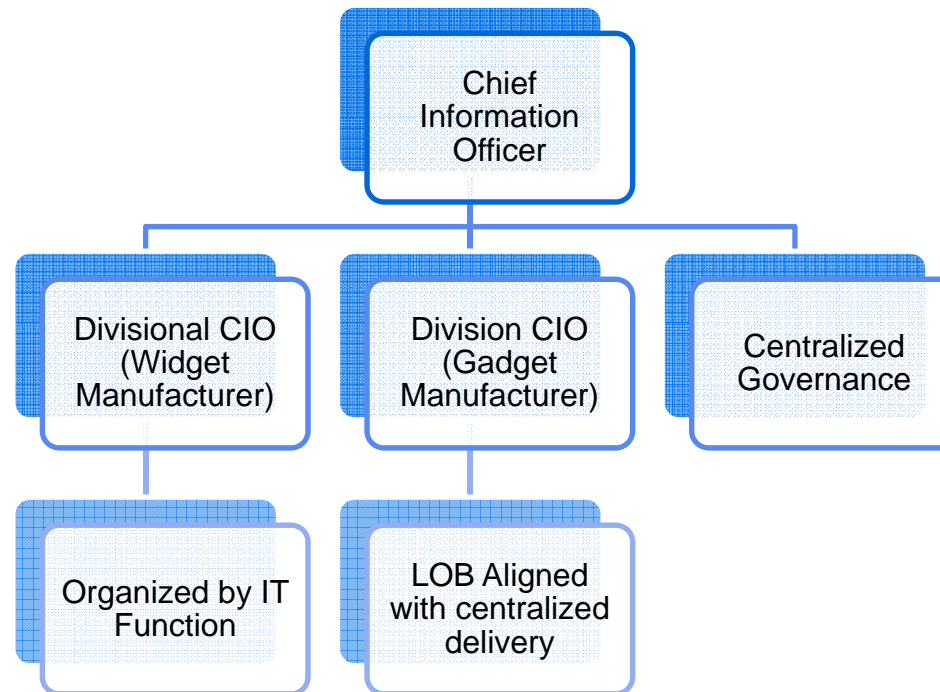

## LOB Aligned with centralized delivery

- Divisional CIO focused on delivering solutions for a single Line-Of-Business
- Centralized teams provide common capabilities such as Program Management Office, shared services, network management, data centers and application support
- Typical organization for centralized IT where there isn't a large packaged application implementation

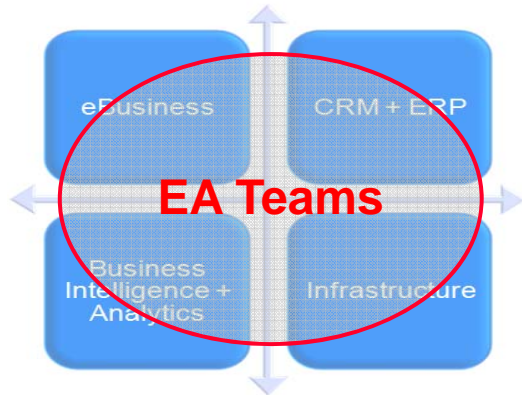

# IT Organization Patterns

## LOB Aligned with different delivery models

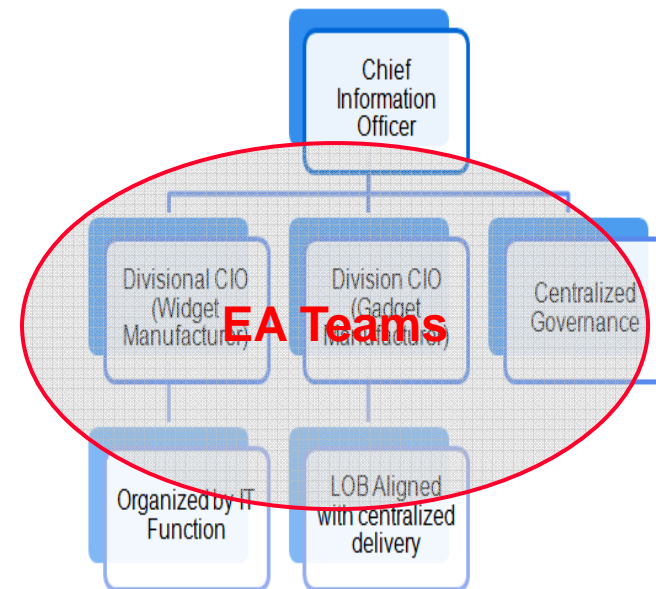

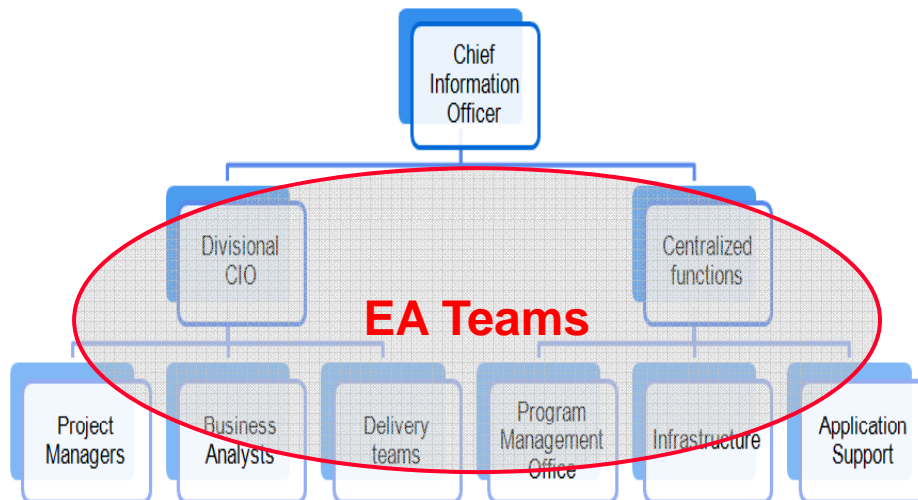

- Autonomous Divisional CIOs responsible for all aspects of delivery for the Line-Of-Business
- Global/Centralized CIO responsible for strategy and governance – limited say in the operations of Divisional CIOs
- Typical for very large organizations

# Enterprise Architects brings consistency across the enterprise – independent of the IT Organization model

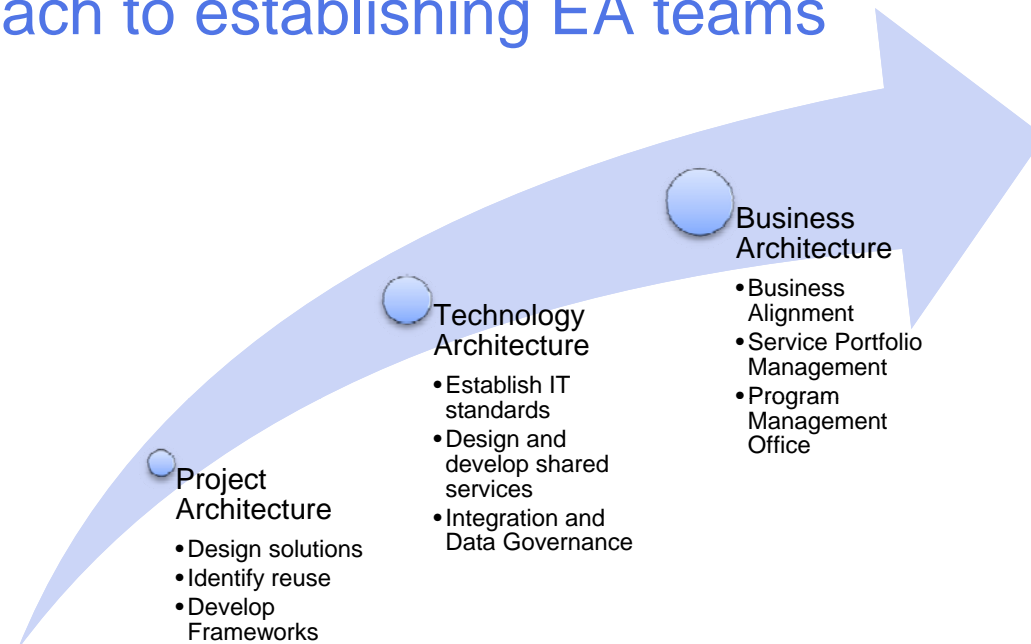

- Typically only the CIO gets the enterprise perspective
- CIO could dramatically increase IT efficiency by establishing EA teams that directly report to him/her
- EA teams would work on behalf of the CIO to provide consistency and flexibility across the enterprise

# Enterprise Architecture Evolution Pattern

## Phased approach to establishing EA teams

- **Project Architecture:** Provide visibility and demonstrate value of the team; limit involvement to strategic projects
- **Technology Architecture:** Leverage standards to demonstrate business value based on ROI, shared services delivery part of EA team, engage business for managing Integration and Data Governance process
- **Business Architecture:** Challenge business silos to align their priorities based on enterprise objectives, program management office now part of EA teams

# Thank You
